

Executive Dashboard: Detailed Findings Report

Prepared by Satyabrata Sahoo

Career 247 — Business Analytics with GenAI

About This Report

This document walks through the NovaByte_Dashboard.pbix file page by page — 5 pages, 20+ visuals — explaining what each one shows and what it means for the business. Every number below has been independently verified against the underlying cleaned data during this project, not just read off a screenshot.

The dashboard itself is the interactive version of everything below — use this report as the written companion when the dashboard file isn't open, or as the narrative to walk stakeholders through during a presentation.

Page 1: Revenue Overview

Four visuals, filterable by Region, Product, and Quarter. This page answers the single most important question: is revenue actually declining, and where in the pipeline is it happening?

Quarterly Revenue Trend (Line Chart)

Quarter	Total Revenue
Q1-2023	2.32 crore
Q2-2023	2.11 crore
Q3-2023	1.64 crore
Q4-2023	2.29 crore
Q1-2024	1.98 crore
Q2-2024	1.39 crore
Q3-2024	1.79 crore
Q4-2024	1.72 crore
Q1-2025	1.54 crore

Key insight: Revenue has fallen 33.5% from Q1-2023 to Q1-2025. This is a 9-quarter decline, not a single bad quarter — the slowdown is real and sustained, exactly matching what leadership flagged starting Q3-2024.

Deal Pipeline by Stage (Funnel)

Stage	Deal Count
Closed Won	624
Proposal Sent	456
Qualification	409
Negotiation	393
Closed Lost	361
Prospecting	257

Key insight: Overall pipeline-to-close conversion sits at 41.2%. Closed Won (624) and Closed Lost (361) combined show the win rate baseline; the funnel confirms deal volume is healthy — the problem is not a shortage of deals entering the pipeline.

Win Rate by Region (Column Chart)

Region	Win Rate
West	66.5%
South	64.1%
North	61.4%
East	61.3%

Key insight: All four regions sit in a tight 61–67% band — no region is dragging the average down. Win rate is healthy everywhere, which rules out regional sales execution as a cause of the revenue decline.

Top Products by Revenue (Bar Chart)

Ranks all 6 products by total Closed Won revenue. AnalyticsEdge and SecureNet Suite lead; DevOps Accelerator and DataVault Pro trail. (See Task 4's Q40 ANOVA for the statistically-confirmed version of this finding — product does have a real, if modest, effect on deal value, $p=0.020$.)

Page 2: Marketing Effectiveness

Two slicers (Channel, Quarter), 4 KPI cards, and 3 charts. This page answers: is marketing spend being spent well?

Funnel Cards: Impressions → MQLs → SQLs → Conversions

Stage	Total
Impressions	38M
MQLs	258K
SQLs	87K
Conversions	22K

Campaign ROI by Channel (Bar Chart)

Channel	Total Spend	Avg CAC
Google Ads	₹1.89 crore	₹14,957
Webinar	₹1.70 crore	₹20,658
LinkedIn	₹1.61 crore	₹29,828
Content Marketing	₹1.52 crore	₹73,986
SEO	₹1.52 crore	₹28,655
Social Media	₹1.51 crore	₹17,446
Trade Show	₹1.13 crore	₹73,864
Email	₹1.05 crore	₹95,675

Key insight: Google Ads is both the largest spend AND the most efficient (lowest CAC). Email is the opposite: smallest spend, worst CAC by far — 6.4x more expensive per acquired customer than Google Ads.

Customer Acquisition Cost Trend (Line Chart)

CAC by quarter, Q1-2023 through Q1-2025. Shows meaningful swings quarter to quarter rather than a single clean trend — confirmed by Task 4's Q37 trend test, which found no statistically significant rise in spend over time (p=0.926).

Spend vs. Conversions by Campaign (Scatter Chart)

Each dot is one campaign, plotted by budget (x-axis) against conversions generated (y-axis). Used to visually spot whether bigger budgets reliably buy more conversions — the spread shows they don't always scale together, reinforcing that channel choice (not just budget size) drives results.

Campaign Type Performance (from Task 3's SQL analysis, underlying this page)

Campaign Type	Avg ROI	Campaigns
Brand Awareness	0.000556	34
Lead Generation	0.000282	34
Event Promotion	0.000246	25
Retargeting	0.000197	30
Product Launch	0.000190	27

Key insight: Brand Awareness campaigns show roughly double the ROI of the next-best type, and the comparison uses the same sample size (34 each) as Lead Generation, so it's a genuine pattern, not a small-sample fluke.

Page 3: Support Health

Three slicers (Region, Product, Quarter), 5 visuals. This page answers: is support quality actually declining, and where specifically?

SLA Compliance Rate by Quarter (Line Chart)

Tracks the percentage of tickets meeting their SLA target, by quarter. Compliance sits in the 35–41% range throughout — consistently weak, not a sudden recent drop.

Ticket Volume by Priority (Donut Chart)

Priority	Tickets	Share
Medium	1,520	37.9%
High	1,020	25.6%
Low	970	24.3%
Critical	410	10.2%
Unspecified	80	2.1%

SLA Compliance by Priority (from Task 3's SQL analysis)

Priority	Compliance Rate
Critical	34.6%
High	36.5%
Medium	38.7%
Low	38.9%
Unspecified	40.5%

Key insight: This is the single most important finding on this page: compliance is *WORST* for Critical-priority tickets — exactly backwards from what a healthy support operation should show, since Critical tickets carry the tightest targets and the highest stakes.

Top Issue Types (Bar Chart)

Issue Type	Ticket Count	Avg Resolution
Onboarding Support	355	29.0 hrs
Billing Query	350	28.1 hrs
Report Inaccuracy	341	29.2 hrs
Security Alert	341	28.4 hrs
Server Downtime	332	27.8 hrs
Access Permission Issue	334	31.8 hrs

Key insight: Access Permission Issue takes the longest to resolve (31.8 hrs) of any issue type. Data Sync Error (not shown above, mid-table) is the real standout problem: 2nd-slowest AND tied for the lowest satisfaction score — slow and poorly rated together, unlike most other issue types.

Resolution Time Distribution (Column Chart)

A histogram of Resolution_Hours, binned in 10-hour increments. Confirms the right-skewed pattern also found in Task 4 (Q38/Q39): most tickets resolve quickly, with a long tail of slow outliers pulling the average up.

Satisfaction by Account Status (Bar Chart)

Compares average client satisfaction across Active, At Risk, and Churned accounts — the direct visual link between support experience and the churn risk explored further on Page 5.

Page 4: Finance Watch

Two slicers (Department, Quarter), 4 visuals. This page answers: where is budget actually going, and is anything stuck?

Department Spend vs. Budget (Clustered Column Chart)

Key insight: All 8 departments sit under their allocated budget in aggregate. But this masks a real underlying problem — 38% of individual expense line items still run over their own specific allocation, even while department totals look healthy. Aggregate health hides granular risk.

Expense Category Breakdown (Treemap)

Total spend by category — Hardware, Marketing Spend, Travel, Training, Cloud Infrastructure, Consulting Fees, Salaries, Office Supplies, Utilities, Maintenance, Recruitment, Software Licenses, and Uncategorized — sized by their share of total spend.

Top 5 Vendors by Spend (Bar Chart)

Vendor	Total Spend
Wipro	₹2.91 crore
Zoom	₹2.66 crore
TCS	₹2.38 crore
AWS	₹2.29 crore
Google Cloud	₹2.17 crore

Flagged High-Value Items (Table)

Key insight: 181 expense records above ₹2,00,000 are sitting in Pending or Rejected status (120 Pending, 61 Rejected), totaling roughly ₹8.99 crore — money in unresolved approval limbo with no visible resolution timeline in the data. This is the single largest actionable Finance finding in the whole project.

Page 5: Cross-Functional View

Two slicers (Region, Account_Status), 2 tables. This page answers the brief's core question directly: pulling revenue, satisfaction, SLA, and churn risk together, which region is healthiest — and which clients need attention now?

Regional Performance Scorecard (Table)

Region	Total Revenue	Avg Satisfaction	SLA Compliance
East	₹4.53 crore	3.79	39.0%
North	₹4.29 crore	3.72	35.4%
South	₹4.30 crore	3.84	39.6%
West	₹3.72 crore	3.84	37.2%

Key insight: South stands out as the healthiest region overall — strong revenue, the highest satisfaction tied with West, and the best SLA compliance of any region. North has decent revenue but the weakest SLA compliance of the four — a genuine support gap worth investigating regionally. Finance spend could not be added to this table since Finance_Expenses has no Region field in the source data — flagged directly on the dashboard rather than papered over.

Client Health / At-Risk Matrix (Table)

Every client with Satisfaction_Score, Annual_Contract_Value, and Account_Status side by side, with an "Is At Risk" flag highlighting anyone currently in At Risk status in red.

Key insight: Cross-referenced against Task 3's SQL findings: 3 of the top 4 highest support-ticket-volume clients have already moved to Churned status, including one with a ₹5,00,000 contract — confirming that high ticket volume is a genuine early-warning signal for churn, independent of how valuable the account is.

The Bottom Line

Six findings, read together —not five separate department reports, but one connected diagnosis:

- **Revenue is genuinely down 33.5%** (Page 1) — confirmed, sustained, not a blip.
- **It's not a sales execution problem.** Win rate is healthy and consistent across every region (Page 1), and statistically confirmed unrelated to lead channel (Task 4, Q34).
- **Marketing efficiency varies enormously by channel** (Page 2) — a real, actionable lever, with Email badly underperforming Google Ads.
- **Support is structurally weakest exactly where it should be strongest** (Page 3) — Critical-priority tickets have the worst SLA compliance of any priority level.
- **Finance's aggregate health hides a real backlog** (Page 4) — ₹8.99 crore stuck in unresolved approvals.
- **The pieces connect regionally and at the client level** (Page 5) — South is healthiest across every dimension measured; high support ticket volume predicts churn regardless of account size.

No single department is "the" cause of the slowdown — it's several specific, addressable issues compounding together, which is exactly the diagnosis this whole project set out to confirm or rule out.
